----	----------------	----

1. Introduction

Lets talk about:

- Medical Treatment of Tumor
- Radio frequency ablation
- Why RFA Simulation is important
- Motivation
- This project in General

2. Computer-aided simulation of radio frequency ablation with finite elements

2.1. About Errors in simulations and numerical approaches

- see TUM dissertation
- There are different sources for errors following the simulation from the line from the real problem down to the discrete solution
- Idealization error: discrepancy between reality and the idealized reality and the idealized constitutive laws and boundary conditions -> Systems are often way more complex in reality, every patient is different
- Modeling errors: discrepancy between mathematical formulation and physical model -> e.g. using dimensionally reduced approaches, like linear dependencies or even constant parameters
- Discretization errors: discrepancy between the continuous description and discrete description of the model
- Solution errors: using iterative approximation methods and rounding errors
- It's basically a butterfly effect
- Optimizing one error source often conflicts with another one -> e.g. handling nonlinearity can cause fatal numerical errors (at least that's what Kroeger said ...)

2.2. Theory of finite elements

2.2.1. Elliptical problems

- Elliptical problems in general
- build up system of PDE's to describe problem
- Using the cylindric domain, different domains

2.2.2. FEM for electrical fields

- special domain
- boundary conditions

2.2.3. FEM for temperature fields

- boundary condition (heat source or sink)

2.2.4. Axial symmetrie

- Using axial symmetrie to simplify computations
- reducing one dimension 3D -> 2D
- significant savings calculations time and complexity
- approach: fourier decomposition in angular direction to reduce dependency on the angular φ
- using static models, only dependency on space
- maybe Torus elements

2.3. This part is about the concrete PDEs itself

2.3.1. FEM in zylindric Coordinates

- Rewrite the equations to zylindric coordinates

Laplace in kartesian coordinates:

$$\nabla^2 := \Delta := \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \quad (1)$$

Laplace in cylindric coordinates:

$$\Delta := \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2 f}{\partial \varphi^2} + \frac{\partial^2 f}{\partial z^2} \quad (2)$$

Laplace in polar coordinates:

$$\Delta := \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \varphi^2} \quad (3)$$

2.3.2. PDE for Electric potential

Three parts are interesting: - Inner domain

- Fixed Potential of electrodes
- Inner domain
- Outer boundary -> Robin

Constant material parameters:

Inner Domain

The PDE :

$$-\nabla \cdot (\sigma(x, y, z, t) \nabla \phi(x, y, z, t)) = 0 \quad (4)$$

- Elliptical boundary problem
- Assuming constant material parameters: Equation becomes Laplaces equation, phi becomes time independant

$$\sigma \Delta \phi(x, y, z) = 0 \quad (5)$$

- Using zylindric domain, we can use cylindric coordinates

2.3.3. Electrodes

2.3.4. Outer boundary

The inner domain:

TODO

(6)

3. Applied FEM-Simulation

3.1. Grid generation / Triangulation

3.2. Get TestData

3.3. Solving the PDEs

3.3.1. numerical challenges

3.3.2. numerical integration

3.3.3. solving the system of equations

3.4. Interpretation of result numbers

3.5. Graphical output

3.6. Optimization

3.7. MatLab vs C++

- Basically the performance advantages of using C++

4. Summary and Outlook

4.1. Project Summary

This is the conclusion part

4.2. strengths and flaws

- why is it good, why is it bad

4.3. State of the current Research

- Research in the simulation of medical therapy methods

4.4. Other FEM projects and software
